INVESTIGATING THE EFFECTS OF
COVID-19 ON AUSTRALIAN
FOOTBALL GAMES INTENSITY

9. CONCLUSION

INTRODUCTION

- The Australian Football League (AFL) takes place across Australia throughout the year.
- The 2020 season was affected by the COVID-19 pandemic which reduced the number of matches played and match length.

OBJECTIVES

Investigate the differences in match intensity of the COVID-19-affected season, compared to other seasons between 2018 and 2022.

Analyse team performance indicators and provide an adjustment factor for the reduced match length for future analysis.

WHAT IS AFL?

- Two teams of eighteen players on an oval-shaped field.
- Total game time of 80 minutes.
- Aim to kick the ball between goal posts.
 - 6 Points between the red posts
 - 1 Point between the other posts
- Ball can be kicked, ran with, or 'hand-balled'
 - Hand-ball: Holding the ball in one hand and punching it with the other.

AFL DURING COVID-19

- AFL began as per usual at the beginning of 2020, but only the first round was played before COVID-19 paused the season.
- Games were reduced to 64 minutes.
- Strict measures were in to prevent COVID-19 spread through the AFL roster.

VARIABLES

Total Team Scores

- The points scored in a game by one team

Performance Indicators

Disposals

- Legally getting rid of the ball, such as through a handball or kick.

Marks

- When a player catches the ball when it is kicked in the air by another player.

Tackles

- Using physical contact to prevent the opposing team getting an effective disposal.

One-Percenters

- Small extra efforts that make turnovers more likely. Such as chasing, bumping and blocking.

INVESTIGATING INTENSITY

TEAM SCORES

$$H_0: \mu_{\text{covid}} = \mu_{\text{non-covid}}$$

$$H_A: \mu_{\text{covid}} \neq \mu_{\text{non-covid}}$$

p-value: 3.66×10^{-4}

Conclusion: reject the null hypothesis in favour of the alternate.

INVESTIGATING INTENSITY

DISPOSALS

$$H_0: \mu_{\text{covid}} = \mu_{\text{non-covid}}$$

$$H_A: \mu_{\text{covid}} \neq \mu_{\text{non-covid}}$$

$$\text{p-value: } 3.23 \times 10^{-1}$$

Conclusion: fail to reject the null hypothesis.

INVESTIGATING INTENSITY

$$H_0: \mu_{\text{covid}} = \mu_{\text{non-covid}}$$

$$H_A: \mu_{\text{covid}} \neq \mu_{\text{non-covid}}$$

p-value: 8.09×10^{-5}

Conclusion: reject the null hypothesis in favour of the alternate.

MARKS

INVESTIGATING INTENSITY

TACKLES

$$H_0: \mu_{\text{covid}} = \mu_{\text{non-covid}}$$

$$H_A: \mu_{\text{covid}} \neq \mu_{\text{non-covid}}$$

$$\text{p-value: } 9.06 \times 10^{-4}$$

Conclusion: reject the null hypothesis in favour of the alternate.

INVESTIGATING INTENSITY

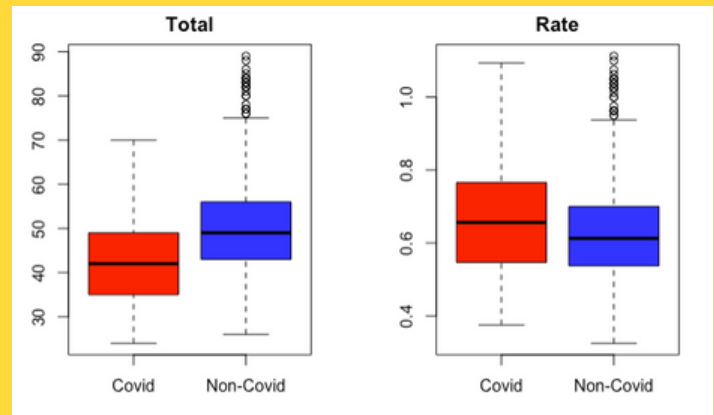

ONE PERCENTERS

$$H_0: \mu_{\text{covid}} = \mu_{\text{non-covid}}$$

$$H_A: \mu_{\text{covid}} \neq \mu_{\text{non-covid}}$$

p-value: 1.96×10^{-6}

Conclusion: reject the null hypothesis in favour of the alternate

INVESTIGATING INTENSITY - FINDINGS

- We found a statistical difference between the Covid affected season opposed to the Non Covid season.
- Of the four performance indicators, only disposals were found to have no discernible difference.
 - Tackles, marks, and one percenters were found to be statistically different.
- Further testing would be necessary in order to determine how much the Covid affected season differed.
 - Such as post-hoc analysis
- From this we can conclude that there is a discernible difference in intensity in matches affected by Covid and those that were unaffected.

ADJUSTING INDICATORS

- Investigating adjustments that can be applied to the covid affected variables to align them with a regular season.
- Scale factor to adjust covid value to non-covid

Total score	0.74	(decrease by 26%)
One percenters	0.94	(decrease by 6%)
Disposals	0.99	(decrease by 1%)
Marks	1.05	(increase by 5%)
Tackles	0.96	(decrease by 4%)

TO CONCLUDE...

CONCLUSION

Investigating intensity

- Statistical difference between one-percenters, marks, tackles and total score in covid and non-covid conditions
- No statistical difference for disposals

Adjusting indicators

- PIs cannot be adjusted pro-rata according to game length
- Many PI rates increase for covid games, indicating an increase in intensity
- Perhaps suggesting fatigue impact on the game
